Chemistry Study Guide Stoichiometry

The relative masses were obtained by multiplying the atomic ratios and atomic masses. You can see that a sample of N_2O weighing 44.02 grams contains 28.02 g of nitrogen and 16.00 g of oxygen. The mass percent of each element is calculated from its relative mass divided by the sum of the relative masses. Chemical compounds with integral atomic ratios, like nitrous oxide, are described as stoichiometric compounds, and they permit many simple calculations.

Stoichiometry - CliffsNotes Study Guides

1. Define the following: a. Stoichiometry-the study of the quantitative relationships between the amounts of reactants used and the products formed by a chemical reaction. b. Mole -The SI unit used to measure the amount of a substance that contains 6.02×10^{23} atoms of that substance. c. Mole Ratio-The ratio between any two substances in a balanced chemical equation.

Given a chemical reaction, stoichiometry tells us what quantity of each reactant we need in order to get enough of our desired product. Because of its real-life applications in chemical engineering as well as research, stoichiometry is one of the most important and fundamental topics in chemistry. Introduction to the Mole

A common type of stoichiometric relationship is the mole ratio, which relates the amounts in moles of any two substances in a chemical reaction. We can write a mole ratio for a pair of substances by looking at the coefficients in front of each species in the balanced chemical equation.

The best definition for stoichiometry is the simple one: it's a way to figure out how much stuff you're going to make in a chemical reaction, or how much stuff you'll need to make a chemical reaction do what you want. When we put it that way, stoichiometry isn't so bad. We can deal with the crazy name if it's that simple.

Chapter 10 Chemical Calculations and Chemical Equations

Chemistry is a wasteful science. Reactions are not 100% efficient. When we mix reactants, not 100% will react, giving us less product than expected. In other words, the actual mass of product we get is a percentage of the theoretical mass of product calculated using stoichiometry. We call this percentage the percentage yield.
