In order to optimize the range resolution, a nonlinearity calibration approach is presented to solve the signal distortion. To verify the imaging performance of the THz radar, the inverse synthetic aperture radar experiments are performed and the imaging results obtained by the 2-D fast Fourier transform method and back-projection algorithm, respectively, show that the THz radar can achieve high resolution in the range and azimuth dimensions.

Synthetic aperture radar (SAR) imaging is a way to synthesize very large antenna array by moving single antenna on a known path. If there are no moving targets in the scene then one radar taking many measurements along a path gives the same result as one ridiculously large radar that is as long as the movement path. SAR imaging of a single target.
