When an aircraft is designed, it's normally done with a couple of engine options from different manufacturers. This gives the airline customers the choice, depending on their commercial needs. The Boeing 787 Dreamliner, which I fly, comes with the option of either the General Electric GEnx or the Rolls-Royce Trent 1000.

Powering the Dreamliner: How the 787's GEnx Engines Work

Some typical values of the exhaust gas velocity v_e for rocket engines burning various propellants are: - 1,700 to 2,900 m/s (3,800 to 6,500 mph) for liquid monopropellants, - 2,900 to 4,500 m/s (6,500 to 10,100 mph) for liquid bipropellants, - 2,100 to 3,200 m/s (4,700 to 7,200 mph) for solid propellants.

The engine carries composite technology into the fan case. The engine market for the 787 is estimated at US\$40 billion over the next 25 years. A first is the elimination of bleed air systems using high temperature/high pressure air from the propulsion engines to power aircraft systems such as the starting, air-conditioning and anti-ice systems.

A jet engine is a type of reaction engine discharging a fast-moving jet that generates thrust by jet propulsion. While this broad definition can include rocket, water jet, and hybrid propulsion, the term jet engine typically refers to an airbreathing jet engine such as a turbojet, turbofan, ramjet, or pulse jet. In general, jet engines are combustion engines.

A propelling nozzle is a nozzle that converts the internal energy of a working gas into propulsive force; it is the nozzle, which forms a jet, that separates a gas turbine, being gas generator, from a jet engine.. Propelling nozzles accelerate the available gas to subsonic, transonic, or supersonic velocities depending on the power setting of the engine, their internal shape and the pressures ...

So, can anyone give me an idea of how fast the exhaust gases/air is moving when it leaves a 747's RR jet engine? Or its other types of jet engines. Is the speed of a jet engine's exhaust flow several thousand mph? The RollsRoyce RB211-524 engine is rated at 58,000 to 60,000 lbs of thrust. How do you calculate the velocity of that thrust?

Almost all commercial jet engines have subsonic exhaust velocity (<340 m/s). EFFECTIVE exhaust velocity is not really a velocity at all. It's a measure of EFFICIENCY. The effective exhaust velocity number is derived from the specific impulse of a propulsion system (normally measured in seconds), multiplied by g (the acceleration due to gravity).

What is the difference between actual exhaust velocity and ...

The GENx is the fastest-selling, high-thrust jet engine in GE Aviation history with more than 2,700-plus engines in-service and on order. GENx is the best-selling engine on the 787 Dreamliner in addition to powering the four-engine Boeing 747-8.

The exhaust velocities, Mach numbers, and mass flow rates are largely fixed by the engine cycle, and one has little freedom to alter them. In broader terms, in a dual-stream jet, shaping exhaust flow away from traditional configurations has the potential for significant noise reduction; therefore, substantial noise reduction is achievable by ...
