What's that Skull? How to Identify What Critter It Was!

Skull Key to Adult Land Mammals Although mammalian teeth exhibit similar components, the number, size, shape, and structure of teeth vary widely among mammals. Part of these differences corresponds to differences in diet. Number, size, shape, and structure of teeth also serve as valuable tools in the classification and identification of mammals.

Skull Key to Adult Land Mammals

dichotomous key is a tool used by biologists to identify organisms in a group through a process of answering yes or no questions about the organism. Dichotomous means 'divided into two parts', as each question about an organism has two choices. There are dichotomous keys to identify animals, insects, plants and many other things.

Animal Classification Using a dichotomous key

A dichotomous key is based upon the use of paired, mutually-exclusive statements called coupletsthrough which the user proceeds, making choices about the object at hand until finally an identification is obtained. The term dichotomousrefers to the paired nature of the statements, and comes from the Greek word dichotomiameaning "dividing in two."

Technical Key to Species of Mammals in Kansas

Have the groups become experts on their skull by: □ Drawing a rough sketch of the skull □ Identifying key characteristics using the rodent skull and carnivorous mammal skull diagrams □ Using the dichotomous key to identify their skull Once the group has confirmed their identification with the teacher, have them hide their skull in a box and then pair up with another group and play "Guess Who".

Guess that Skull - Environmental Education Program

A dichotomous key can help identify the family group and specific identity of mammals by asking a series of questions. A key can only help identify the specific group of mammals for which it was developed. For example, a key developed to identify marine mammals would not correctly identify a land mammal.
