In May we published a piece on Ptex and UDIMs (UV mapping). This caused some interesting discussions, to say the least! Here is Part 2 of that article putting the case for Ptex, and perhaps addressing some of the issues raised in the original fxguide story. For this perspective on the issue of texturing we spoke to several members of Walt Disney Animation Studios.

UDIM is a way of assigning multiple images to a single UV map, using a number to indicate blocks of UV space separated into ten columns of U before V increments. This makes parsing an image list used for texturing simple given that the images will have numbered filenames (1001, 1002, 1003... 1011, 1012, 1012...).

### **UV - LightWave 2020**

The main drawback of the traditional UV map is that you can not have different mapping resolutions for each part of the model. If you have one single UV map for the entire model, and a specific part of the model needs to be highly detailed, for example the face, you are forced to make the entire body texture at that high resolution, creating large files unnecessarily.

This UVS file is used in conjunction with UV Mapper Pro to convert La Femme's UV Layout from 5 individual tiles (UDIM) to all UV's located in the main tile (0-1 uv space). This should make La Femme compatible with texturing programs that do not support UDIM UV mapping. To use this UV set, first unzip this package to your desktop or any other location of your choice.
